Seattle company launches GPS emulator based on Garmin® GTN™ navigator

SEATTLE - Just weeks after receiving FAA certification for their newest flight simulator, one-G simulation adds another key component to their product line. The 1G-650™ faithfully emulates the cockpit operation and functionality of the popular Garmin® GTN™ aviation navigation equipment. With Garmin® GTN™ series navigators increasingly common in general aviation aircraft, the 1-G650™ demonstrates one-G simulation's commitment to affordable, high fidelity training solutions for pilots of all levels.

The emulator, which mimics the functionality of the actual Garmin GTN™ unit, is believed to be the first of its kind.

“There has been something of a race among competitors to produce an emulator of this type and we’re confident this is the first such device with FAA approval,” said Xylon Saltzman, CEO of one-G simulation. “With its realistic touchscreen interface and accurate feature set, including a fully updatable FAA database, we expect demand to be high.”

The 1G-650™ is available as an option within the company's product line of Advanced Aviation Training Devices (AATD). Existing owners of one-G simulation AATDs may upgrade their instrument panels to include the 1G-650™. In all applications, the 1G-650™ allows pilots to achieve a high level of operational proficiency before leaving the ground and without the safety concerns of attempting to learn the equipment while in flight.

Pilots can demo and train with the device at Saltzman's flight school, modern pilot, located in Seattle.
